Nhill 3.0

Français : README.md

Named in tribute to Napoleon Hill. Multi-business commercial management suite for traders and SMEs: three applications on one secure server.

Application	For	Platforms
Nhill Business	traders, entrepreneurs, SMEs: sales (quotes, orders, invoices, credit notes), customers and suppliers, products and stock, purchases, expenses, payments, reports, team and "who did what" log, subscription	Windows, Linux, Android
Nhill POS	cashiers: till sessions, split-payment sales, controlled discounts, returns, 58/80 mm receipts or A4 invoice in the customer's name, closing with difference, X/Z reports	Windows, Linux
Nhill Console	the platform operator (private): server setup, businesses, plans, rights and prices, assignment rules, payment providers, support, erasure of data at the end of the contract, audit	Windows, Linux

- **Server**: C++17, `/api/v1` API, PostgreSQL 15+ (Supabase or self-hosted), isolation of businesses through forced row-level security, no database credentials in the applications.
- **Applications**: C++17 / Qt 6 Quick (QML), one code base; French and English; CDF, USD, EUR... exact amounts, never added across currencies.
- **Nhill is not invoicing software certified by the DRC tax authority (DGI)**: its documents are management documents (see docs/en/legal-parameters.md).

State of version 3.0.0 (29 October 2026, branch `release/3.0.0`)

Item	Actual state	Evidence
Build + tests (common 22; server 122: 121 passed, 1 skipped; setup 6; client 15; real Linux keyring 3)	passed on Ubuntu 24.04	GitHub Actions, branch `ci-results/ci`
Plans and rights (features hidden and refused by the server, limits)	10 server tests (`Plans.*`, every plan and every role); hiding in the applications through `Session.has()` (no automatic interface test for each plan)	`ci-results/ci`
"Remember me" (QtKeychain)	passed: Windows Credential Manager (Windows Server 2022), Keystore of an Android 11 emulator, Secret Service on Linux; not yet on a real phone or user machine	`ci-results/windows`, `ci-results/android-keychain`, `ci-results/ci`
`.deb` packages (server, Business, POS, Console)	built for **Ubuntu 24.04** and **Debian 13**; installed then removed in clean containers	`ci-results/deb-*`, `ci-results/install-*`
VPS set-up kit (`deploy/vps`)	12-check acceptance passed on a fresh CI Ubuntu 24.04 machine; **no real deployment on the Hostinger VPS** (no access)	`ci-results/vps-test`
Windows installers (NSIS, 3 applications)	built (MSVC 2022, Qt 6.5.3); silent installation tested on Windows Server 2022	`ci-results/windows`

Item	Actual state	Evidence
Android APK (Nhill Business, arm64-v8a)	built, third-party notices included; **signed with a debug key** (installable, not publishable); not tested on a real device	`ci-results/android`
API (203 endpoints) and database (71 tables) references	generated from the code and a migrated database; checked up to date by CI	`docs/en/api-reference.md`, `docs/en/database-reference.md`
Marketing website + forms backend	24 pages checked; backend tests on SQLite and PostgreSQL; **not online yet**: `nhill.online` shows Hostinger's parking page, no mail configured (MX, SPF, DMARC)	`ci-results/site-backend-postgresql`, `ci-results/domain-check`
Code signing (Authenticode, Android release key)	**not done** — certificates to acquire	—
External audit, penetration test	**not done**; open risks R1 (Ubuntu 24.04 cpp-httplib) and R2 (Qt 6.5.3) awaiting a decision	security audit

Details, limits and human actions: validation report.

Quick start (development, Linux)

```
scripts/install-deps-linux.sh --with-packaging --with-docs --yes
scripts/build-linux.sh                                          # build + tests
NH_DEV_STATE=/tmp/nhdev scripts/dev/dev-stack.sh start build    # throwaway PostgreSQL + API
127.0.0.1:8080
python3 scripts/dev/seed-demo.py --email demo@example.com        # DEMO business
NHILL_SERVER=http://127.0.0.1:8080 build/client/nhill-business
```

Building every deliverable: build guide (`scripts/build-all.sh`, or GitHub Actions on a `release/**` branch).

Every Markdown document has its generated PDF (`docs/pdf/`, `legal/pdf/`, `marketing/pdf/`, `README.pdf`, `README.en.pdf`) produced by `scripts/build-docs-pdf.sh`. The documents of versions 0.1 to 2.x are archived in `docs/archive/` (French, no longer maintained).

Repository layout

```
common/      shared C++ library (amounts, codes, validation, portable 128-bit integer)
server/      C++17 API (http, services, setup, jobs, pdf), country profiles, translations
client/      Qt 6 applications: src/, qml/Nhill/{Ui,Business,Console,Pos}, i18n/, android/
db/          migrations 0001–0015 (digests checked)
tests/       common, server (throwaway PostgreSQL), client, standalone test tool
packaging/   Debian, Windows (NSIS), Android, third-party notices
deploy/      server: systemd, Caddy, backups, Hostinger VPS kit
scripts/     build, verification, release, QA, i18n, development
website/     FR/EN marketing website and form backend
docs/ legal/ marketing/   documentation, legal and commercial files (FR/EN, MD + PDF)
.github/     CI workflows (tests, Linux packages, Windows, Android, documentation and website)
```
